NO COAL IN OAKLAND!

Big Coal is teaming up with a local developer to transport its toxic fuel through Oakland for export!

Up to 9 million tons of coal could come through Oakland annually from Utah mines to be shipped from a new terminal at the former Oakland Army Base.

Coal transport has serious local health and safety impacts as well as disastrous effects on the global climate. Coal dust would poison the air we breathe - causing asthma, cancer and heart disease. And burning coal contributes to global climate disruption more than any other fossil fuel - no matter where it's burned.

Tell the Oakland City Council to stop this toxic coal proposal.

The Council can protect the health of communities, workers and the climate by acting now to stop coal exports. This terminal can export non-toxic bulk goods such as grain, gravel, sand and steel, bringing to Oakland much needed jobs, business, and benefits.

We don't need to export coal!
