## About this poll

This report presents the results of an automated voice polls (robo poll) conducted in Queensland.
The questionnaire was constructed by Essential Research in consultation with Fair Agenda.
Essential Research commissioned Ask Australia to conduct the fieldwork and data collection.

The sample was selected randomly from comprehensive telephone lists for Queensland (landline and mobile).

The survey was in the field from $17^{\text {th }}$ to $19^{\text {th }}$ February 2017.
The sample achieved was 1,201 people aged $18+$.
The completed data was weighted to ABS Census for region, age and gender.
SPSS software and Microsoft Excel were used to analyse and present the data.

## Survey Reliability

Properly constructed sample surveys can provide results that are described as statistically reliable. The level of statistical reliability is dependent upon the sample size and (except where it is extremely small) the size of the population has no practical effect.

A survey that has 800 respondents will provide results that are - at the $95 \%$ confidence level subject to a sampling variation of between $2 \%$ and $3 \%$ at the total response level. Sub-samples, because of their smaller size, will exhibit larger sampling variances.

Overall the confidence level was set as $95 \%$. In this report where variation in sub-samples is statistically significant a comment has been made.

For the purposes of simplicity we have rounded percentages to the nearest whole number. This may result in some percentage totals being $99 \%$ or $101 \%$.

The following table shows the sampling variances at the $95 \%$ confidence level for a range of sample sizes and response levels.

| Sample Size | Variation where the answer is near the <br> percentage of |  |  |  |  |
