

REVISED STAFF RECOMMENDATION FOR POLICY 4.10:

RE Policy 4.10: Require utility-oriented RE project applications to include a community compatibility report to outline project benefits and measures intended to protect the quality of life and economic opportunities in existing unincorporated communities.

- RE 4.10.1: The community compatibility report shall identify elements of the project site design that have been incorporated to enhance compatibility with surrounding properties and existing communities. The report may be preliminary upon submittal, and may be updated as application review and environmental analysis proceeds. The following subjects shall be addressed, if applicable:
 - If the project site is located within the boundaries of an adopted community plan, include an analysis of consistency with community values and aspirations outlined in the community plan.
 - Explain how natural features of the site, such as elevation, topography or vegetation, combined with project design, will minimize potential visual impacts of the project.
 - Explain how planned improvements to the project site will minimize impacts or benefit other properties. This may include avoidance of natural drainage courses, making improvements that will reduce drainage impacts on downstream properties, allowing for wildlife movement through or around the site, or minimizing and managing impacts of blowing sand.
 - Identify any benefits to public utilities or public services that may result from construction of the project. This may include energy transmission or distribution system improvements that would enhance energy reliability, water system improvements, or land use conversion that would decrease demand for public services.
 - Detail anticipated on-site or off-site project improvements that will benefit the community at large or other properties, such as road and drainage improvements.
 - Identify any commitment to employ the local labor force or cooperate with local job training or apprenticeship programs.

- Identify any planned efforts to engage County residents and visitors through marketing or public education that will enhance interest in renewable energy and appreciation of the project.
