

Where Does Your Home Electricity Come From?

You plug something in,
and electricity flows

into the wiring in
your home

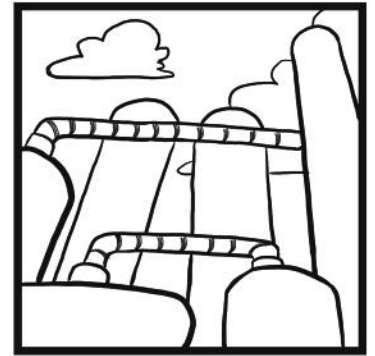

from the wires on
the street

from the gas-powered
electric power plant

from the gas pipelines
(that can leak toxic
methane)

from compressor stations
(that release toxins and
sometimes explode)

connected to the
underground gas
reservoir in Appalachia

where gas is
removed by fracking

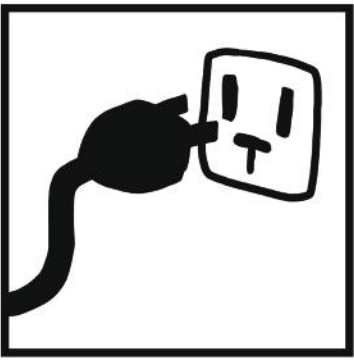

that pollutes the air,
water, and land

and makes the
families there sick.

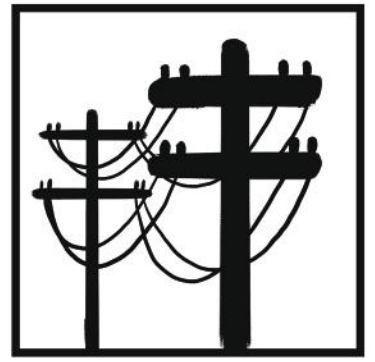

Is that **really** what you want in your
home? Or would you rather...

...plug something in,
and electricity flows

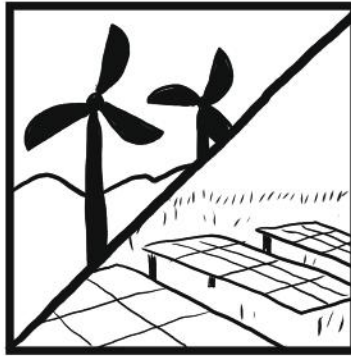

into the wiring in
your home

from the wires on
the street

from the electric power
plant connected to

local solar and
wind farms

that **don't** pollute
water, air, or land

and create good jobs

for the families
nearby

You have the power to switch the source to clean
energy in your home, community, and state!
