

Does a Positive PCR Test Indicate a COVID-19 Infection?

Fear

COVID-19 is spreading rapidly among our population as indicated by increasing positive PCR tests.

Fact

The inventor of the PCR test warned against using it to diagnose viral infections. Other scientists and peer-reviewed studies have also indicated current PCR testing for COVID-19 is being improperly administered resulting in many false positives. Evidence now demonstrates we are in a “casedemic” of false positives rather than a pandemic.
