

CLIMATE CHANGE FEDERAL POLICY

CLIMATE CHANGE POSITION

The SFF acknowledges with a growing population of over 7 billion people on the Earth, the activity of humans over time and other naturally occurring climactic conditions will have some impact on the earth and climate in the long term.

The degree of these human impacts is where the evidence becomes vital in ensuring that any action taken actually has an impact on climate. This must be in parity with Australia's actual 'impact' on a world scale.

What we cannot risk are our democracy, jobs, our economy way of life or standard of living, based on political point scoring exercises.

We will not accept policy based on opinion, popular belief or the views of extremist groups. Our approach is based on rational skepticism, testing the evidence at all times.

A POLICY FOR GOVERNMENT

The SFF is not seeking to form Government. As such, we do not have a specific policy on this. We will support an evidence-based Policy from a State or Federal Government of the day.

Such a policy must use a scientific evidence-based approach, and not unnecessarily restrict the activities of farmers, resources, transport, manufacturing or any other industry. Any economic impacts of an evidence-based climate policy must be thoroughly justified, and costs offset for affected Australian people and Australian owned trading entities.

Such a Government policy should be regularly reviewed to ensure that the results of any change in activity are demonstrated to be having the desired effect.
