LOWER BILLS | MORE JOBS | CLEAN POWER

It's time for all our politicians to commit to 100% renewable power by 2030

The Homegrown Power Plan shows how we can repower Australia with 100% renewable electricity by 2030.

Not only is a move to 100% renewable electricity practical and achievable, it will mean a better, fairer power system and lower electricity bills for everyone.

Here's how Australia can get to 100% renewable power by 2030

Build big solar

The best way to build big solar in the right places, for the right price, is with national reverse auctions. They're just like regular auctions except the lowest bid wins, not the highest. This policy has a proven track-record in the ACT, which is set to deliver 100% renewables by 2020!

Create a national fair price for solar

Solar households only get paid 20% of the price charged by big power companies for surplus power fed back to the grid. Solar homes benefit the whole community by generating local energy for their neighbours to use, so they deserve a fair price in return.

Fund community owned power

We need a federally funded program that kickstarts local, community renewable energy projects in towns and suburbs across the country, so more people can benefit from clean, cheap sun-power.

Protect and expand ARENA and the CEFC

It's time to turbo-charge Australia's most successful clean energy bodies. The Australian Renewable Energy Agency (ARENA) gives grants that make sure innovative clean energy technologies can get to market. Meanwhile, the Clean Energy Finance Corporation (CEFC), our very own green bank, invests to help build them. And get this, the CEFC actually makes us money. How good is that!?

This election, we need all political parties to go for 100%.
